Camber LUE — Sandbox Connection Guide (Camber Test Account)

Prepared for: Camber Test Account
Environment: Camber sandbox (not production)
Date: 2026-09-14

1. Overview

This sandbox environment lets you test submitting loan applications and polling for underwriting results end-to-end. Every request must present a client TLS certificate (mTLS) in addition to an API key. Both are provided below and are dedicated to this Camber test account — do not share them outside your team.

2. Endpoint

Base URL: https://cks39oxid.camber-sandbox.thereportingco.com

Statuses you'll see while polling: RECEIVED -> NORMALIZED -> AUD_SENT -> AUA_RECEIVED -> RESPONDED (terminal, success) / FAILED (terminal, see error.code) / EXPIRED (terminal, timed out).

3. Authentication — API key

Include this key on EVERY request you send us (not just once) using the header below — this is the only header required for authentication, our system checks it fresh on each call:

x-api-key: Txnp1fcfIbsnEYNQdQffnXE7IszKLudK9vUPpWuE1pM

4. Authentication — mTLS client certificate

This certificate/key pair was generated and issued specifically for this Camber test account for sandbox testing — you do not need to generate your own keypair. Configure your HTTP client to present both files on every request (as the client cert and client key for TLS).
